PROJECTS WORKED ON

1. Agent Transaction Control

Duration of Project: 6 Months

Technology Used: VueJS, Nux

Tools used: Docker, Jenkins, JIRA, Figma, Xmind

Team Size: 7-8

Project Description:

- 1.The project ATC involves developing a software solution for California as the pilot state and then expanding to other states of the United States.
- 2.ATC will help resolve the complexities of real estate transactions, highlighting the legal obligations of sellers to disclose information to potential buyers.
- 3.ATC will automate the documentation processes.
- 4.The main goal is to create a system that can handle all transactions/processes in real estate operations in the United States.

Role in the Project:

I worked as a business analyst in this project. As part of the ATC project, I primarily focused on coordinating designs with our UI/UX team to meet the client's requirements. This phase included the online meetings with the client & UI/UX team; the common goal was to deliver a seamless and engaging user experience. My responsibilities included implementing new interface elements and ensuring responsive, high-quality visuals. As we are working on the brand new website, I also contributed to creating the scope & SOW documents, which were later shared with the client for approval.

The other contributions done at the JIRA level to create a project, create user stories, and collaborate with designers, backend teams, and QA engineers were an essential part of my role, ensuring that all updates were well-integrated and aligned with project goals.

2. IWT - Atmosphere

Duration of Project: 3-4 months

Technology Used: Reactjs, Python, Kafka, Spark, Dot net

Tools used: Docker, Jenkins, JIRA, Figma

Team Size: 5-6

Project Description:

- 1.The Atmospheric Analytics Platform is a real-time monitoring and reporting solution designed to support atmospheric condition tracking in underground mining operations.
- 2.Leveraging data from IWT Wireless Gas Monitors via the SENTINEL network, the system provides situational awareness and historical insights on gas, environmental, and ventilation conditions.
- 3.This initiative is a continuation of existing work with the IWT platform, now extending support to new datasets with a user-centered design for mine managers and maintainers.

Role in the Project:

As part of the IWT project, I primarily focused on integrating real-time gas, environmental, and ventilation sensor data into the Analytics Platform. The client has provided Figma designs and we coordinated with our internal team (Frontend, Backend).

This phase included the online meetings with the client & UI/UX team, frontend/backend teams, Architecture team. I also contributed to creating the scope & SOW documents, which were later shared with the client for approval. The other contributions done at the JIRA level to create a project, create user stories, and collaborate with designers, backend teams, and QA engineers were an essential part of my role, ensuring that all updates were well-integrated and aligned with project goals. Additionally, I manage end-to-end project activities, including planning, monitoring progress, mitigating risks and ensuring successful on time delivery.

3. CapReal - WSB

Duration of Project: 1-2 years (Feb-2025 till date)

Technology Used: NextJS, PostgreSQL

Tools used: Docker, Jenkins, JIRA, Figma

Team Size: 5-6

Project Description:

1. WSB portal aims to simplify fund management, documents storage, improve decision-making, enhance transparency, and facilitate better collaboration between the company users.
2. The main goal is to create a system that can handle all transactions/processes in real estate operations in India or abroad.
3. Currently, all operations are handled in Excel templates. The main focus would be to automate these business operations, improve compliance & provide actionable insights through advanced reporting and analytics.

Role in the Project:

I worked as a Business Analyst/ Project Owner in this project. As part of the WSB project, I primarily focused on understanding the banking and finance domain (BFSI). Our core team (BA, Architecture, QA) conducted meetings with the SME from the client side. The client SME provided all the details of the domain, expectations and requirements. I coordinated with our UI/UX team to create Figma designs. This phase included the face to face & the online meetings with the client & UI/UX team, frontend/backend teams, Architecture team. I also contributed to creating the scope & SOW documents, which were later shared with the client for approval.

The other contributions done at the JIRA level to create a project, create user stories, and collaborate with designers, backend teams, and QA engineers were an essential part of my role, ensuring that all updates were well-integrated and aligned with project goals. Additionally, I manage end-to-end project activities, including planning, monitoring progress, mitigating risks and ensuring successful on time delivery.

OTHER PROJECTS

IWT client has requested additional small projects like Predictive compliance integration into the IWT Analytics portal (main site), design & develop AI driven chatbot to help mine level users find their answers more quickly & eForms integration in the IWT Analytics portal site. My contribution for all these projects is at the project owner level where I contributed starting from requirement gathering till the delivery of the projects to the client.

WORK HISTORY

World wide alliance (www.walliance.com)	4 Years Dec 2014- Dec-2018 Business & Integration Analyst
Shipco IT Pvt. Ltd. (www.shipco.com)	6 Years Dec 2018 - Feb-2024 Team Lead - Business Analyst
